

Badge Synchronization Gateway

Software

MICRO-SESAME

MICRO-SESAME

Connecting databases

Data exchange between MICRO-SESAME and other existing databases in the company containing user and badge data may be required.

External, employee or visitor tracking is done using different management, scheduling or HR software.

Automating the synchronization of both the database and the access control system is extremely useful, specially when a large number of badges is in circulation. This will :

- prevent time-consuming duplicates,
- provide real-time data,
- automatically grant access (depending on departments, roles, etc).

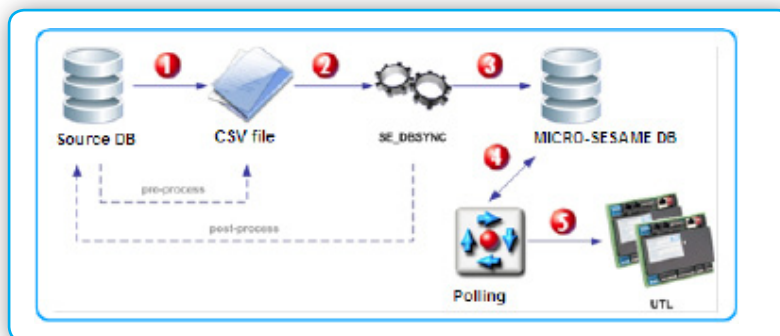

Operating principles

The badge synchronisation gateway (MS-SYNC) is a software option.

It consists of receiving, from the source database, a CSV file that will be automatically integrated to the MICRO-SESAME database.

Automatic back-up can be performed at specific times or every time modifications are made to the source file.

On-demand manual synchronization is also possible.

MICRO-SESAME 2.8 or higher supports the synchronization feature using different sources.

Each of the sources used during the synchronization can have specific synchronisation settings.

In this case, it is recommended to activate the MS-SYNC-MULTI multi-source gateway feature.

References & Pre-requisites

References : **MS-SYNC** : mono-source badge synchronization gateway.

MS-SYNC-MULTI : multi-source badge synchronization gateway.

Compatibility : MS-SYNC MICRO-SESAME v 2.7 or higher.

MS-SYNC-MULTI MICRO-SESAME v 2.8 or higher.

Implementation : Following the pre-sales validation, a TIL Technical Support session may be recommended (references : PREST-SYNC and PREST-SYNC-MULTI)
